

The feed hopper is made of resistant plastic to assure better hygiene and no feed is stuck in the corners. It is very easy to detach the hopper from its base in order to lift the feeding line to a maximum height to facilitate the manure removal and the cleaning of the farm.

The motor is 0.75 hp coupled with a gear and control box including a micro-switch. Another control pan can be included in the middle of the line to restrict the feed distribution to the desired farm area during early age.

Manual and electrical winches are available to lift the line.

Pan Feeding System

For the simplest and fastest operation the feeding pan can be washed through the bottom opening without further operations.

POULTEC pans are made of top quality U.V. and shock resistant materials, with high resistance to acids and other corrosive agents.

The Poultec pan satisfies the needs of poultry feeding from day old till market age. At early age the center piece is simply raised to the highest level what leads the complete filling of the pan allowing day old chicks to feed freely.

For breeder feeding a special cock restricting cover is applied to the pan for an optimal and homogeneous feeding. Special clamps rigidly fix the pan to the pipe and prevent it from swinging to eliminate feed spillage.

- No grill is present on the pan what eliminates the risk of birds being trapped inside it
 - Very rigid composition with screw-less snap-on assembly system
 - An antiperching line is extended above the feeding line
 - A feed saver lip around the pan prevents any feed spillage
 - Increased height of the pipe allows free circulation of the birds
- Easy 7 level feed adjustment done by a simple rotation of the center piece
 - Deep pan bottom resulting in the elimination of feed spillage
- No crevices or hinges or overlapping parts what allows a thorough cleaning
 - The pan can swing freely to prevent damage to the breast of the birds
- possibility to cut off the feed flow to the pan by a simple rotation of the center piece

The Poultec pan provides the perfect solution for turkey feeding throughout the lifecycle. At early age the pan will allow easy feed access to chicks. At 55 days of age an anti-waste ring is installed and remains until the end of the growing cycle.

For controlled or restricted feeding programs it is possible to use a high inner cone leading to a faster feed distribution inside the house

Automatic feed level adjustment is possible through a simple system that will allow maximum feed level when the pan line is lowered to the floor. The feed level will gradually and automatically decrease as the line is raised.

The Poultec pan is also perfectly adapted for duck feeding
